# Figures

1.1 System optimization versus system innovation 2  
1.2 Typology of innovations 5  
2.1 Socio-technical system for modern car-based transportation 20  
2.2 The multi-actor network involved in socio-technical systems 34  
2.3 Alignment of trajectories in socio-technical regimes 35  
2.4 Multiple levels as a nested hierarchy 36  
2.5 A dynamic multi-level perspective on system innovations 38  
2.6 Integration of different literatures in the multi-level perspective 40  
3.1 Four transition contexts and transformation processes 67  
4.1 Laundering as a system of systems 82  
4.2 Horizontal and vertical dimensions of socio-technical change 85  
4.3 Modes of integration 87  
5.1 A transition in the Swiss agri-food chain, 1970–2000 98  
6.1 The evolution of Dutch energy use 115  
6.2 The evolution of energy use in domestic households 126  
7.1 Four phases of transition 140  
7.2 Current policy versus transition management 145  
7.3 The cycle of transition management 146  
7.4 Transition as a goal-seeking process with multiple transition images and goals 148  
8.1 Three democratic systems 184  
9.1 Mitka, May 2002 202  
9.2 Mitka two-wheeled concept 210  
10.1 The key actors in societal embedding 226  
10.2 Societal embedding as a learning loop 227  
10.3 The principle of the ESCO concept 230  
10.4 Process description: societal embedding of ESCO concept in municipalities 232  
10.5 The development of ESCO operations in 1994–2003 236  
10.6 Driving forces for diffusion of ESCO practices in municipalities 237  
10.7 Driving forces for diffusion of diabetes self-management systems 245  
10.8 Two basic modes of societal embedding 248  
11.1 Different transition policies in different phases 256
