ABERS
approach 196
estimate for lower bound 200, 204, 206–7, 218
non-parametric estimator 74
adding-up test
adaptation for 70–73
“adding-up condition”
applying only to goods obtained incrementally 60
consumer preferences not adhering to 67–8
definition 59
description 61–3
deviations from 68
findings 61, 78
implementation of 59
in previous studies 60
testing 60–61
and adequate response to differences in scope 59, 66, 78
applied to restoration program for river system and lake 60–61, 69–75
elicitation method 63, 67–8, 78
explanation 61–3
findings 61, 78
income effects 64–5, 75–7
incremental parts
for accelerated restoration 71
and cognitive burden 64
findings 61, 78
lack of studies on 59–60
meaning 59
in original study’s design 70
past studies review 66–8
use to test adding-up condition 60–61
limitations of scope tests 58–9
original study 68–70
potential difficulties in implementing
cognitive burden 64
cost 66
income effects 64–5
provision mechanism 65
for reliability of CV 88–90
results 73–5
study discussion and conclusions 78
and truthfulness 60–61, 69, 78
adequate
sensitivity to scope 129–37, 140
use of term 88, 140
algae 60, 69, 100, 117, 257, 259
alum 60, 69–70, 72, 74, 100, 117
American Trader spill litigation 299
anchoring
biases 178
cost 2, 5, 10, 84
effects 2, 5, 84, 114, 160, 163, 215, 277
as issue surrounding CV 30, 36
in red knot study 55–6
response distortions in 165
behavior
choice 14, 176–9, 237–8
deterministic heuristic rule
predicting 239–40
ideal, for validity of WTP estimates 224–5
irrational 48
market 153–4, 156–7
protest 232
purchase 172, 277
randomizer 234
surveys of consumer, in court cases 299–300
use of conjoint methods for predicting 162, 168–70, 173, 176
of utility maximizing 231, 255
behavioral anomalies 36, 112, 154
behavioral economics 155, 157, 159
behavioral response
to high bids 17–18, 36
questions to explore 34–5
true 23
behavioral theories 78, 154–5, 157, 159, 252
belief in bid values 32–5
bias ratio (BR) 271–4, 277–85
bids
“composite good” approach
bid levels
cognition difficulties with part-whole relationships 214–15
comparison between composite good and V1 COS 207
non-monotonicity 200
propensity to shift votes 204–6
marine species preservation case 3
percentage of respondents voting for alum treatments 73–4
red knot studies
belief in bid values 32–5
bid amount
non-parametric estimates by 27, 32, 35
percentage of respondents who believed they would pay more or pay less than offered 34
percentage of yes responses at highest 19–21
percentage of yes responses by 27
yes response irrespective of 30
yes responses v. responses adjusted for “believed” 33
yes responses v. responses adjusted for certainty 31
bid design 22, 24–5
bid levels
highest 17–23, 25, 28–36
low-end 22–3, 30
share of “yes” votes 50, 52
bid range 18
non-monotonicity 26
truncated 17–18, 23, 25, 27–9, 36
willingness to pay estimates 28–30, 36
and yes-response function 26–7
single-focus approach bid levels 194–6
and WTP for meal vouchers 67–8
“bounded substitution” 84–5, 88–9, 131
brain activity 178–9
budget awareness
adoption in survey 192
in CVM studies 188
findings 219
three related enhancements 193
“wording additions” intended to enhance 216–19
budget constraint
affecting responses to valuation questions 189
findings 219
in single-focus valuation method 190
in WTP survey methods 189
California Environmental Improvement Program 193–4, 199–202, 205–8, 213, 215
California oil spill (COS) study see “composite good” approach
CBC see choice-based conjoint (CBC)
census weights 54–5
certainty
adjustment 31–2
correction 138–40, 273–6, 279–81, 283–5
elimination of uncertainty 54–5
levels 30–31
questions 30–31
of response 255–6, 262, 266
weights 54–5
cervical screening study 3–4
“cheap talk”
in “composite good” approach 193, 215–16, 218–20
in hypothetical bias study 272, 274, 277, 279–81
in marine species preservation study 6, 228
in scope studies 137–8
choice-based conjoint (CBC)
  behavioral effects 154
  comparison to CVM 154, 160
  elicitation directly mimicking market choice tasks 158
  example of typical menu 158
  as leading SP method 153
  method and applicability 160–62
  study design
    data analysis 176–7
    experimental design 166–8
    failures 177–9
    important issues 162–5
    incentive alignment 170–71
    making menus realistic 173–6
    reconciliation and validation 171–3
    sampling and recruitment 165–6
    subject training 168–70
  as variable in hypothetical bias study 278, 280–81, 283, 285
choice experiment (CE)
  choice
    based on absolute costs 5, 11, 14
    based on relative costs 5, 11, 14
    behavior 14
    corner 10–11
    in higher cost scale 8–11, 14
    in lower cost scale 8–11
    pattern for do-something 2, 5, 8, 10
    pattern for status quo 8, 10–11, 14
    proportions 4–5
    tasks, performing 2
  choice questions
    answering 6
    sample 7, 229
  components 1
    definition 82
    fat tails equivalent for 36
    in hypothetical bias study 272, 278
    implications for choice behavior 14
    method 1–2
    NOAA sponsored online study 202, 216
  popular use of 1
  in previous scope test studies 105–6
  see also choice-based conjoint (CBC); dichotomous choice surveys
  choke price 18, 28
  cognition difficulties
    with part-whole relationships 214–16
    sizeable proportion in responses 209–13
  cognitive burden 64, 258
  “composite good” approach
    “cheap talk” 193, 215–16, 218–20
    composite good version
      priority allocations for components 201–4
      standalone COS
        reactions to scenario 204–5
        values for program 205–6
        valuing Version 2 199–200
  context and rationale
    foci 188–9
    and single-focus approach 189–91
    study design 192–4
    not-for votes 196–7, 200, 206–8, 214, 218, 220
    and single-focus approach 189–91, 199, 205, 208–9, 211, 213–15
  single-good version
    1995 test-bed study
      comparisons 196–8
      similarities and differences 194–6
  study findings
    budget exercise and COS 213–14
    cognition difficulties
      with part-whole relationships 214–16
      sizeable proportion in responses 209–13
    lack of sensitivity to huge scope difference 206–8
    plausible rationalization 219–21
    within-questionnaire “wording additions” 216–19
    single-good v. composite good
      WTP estimates 208–9
  Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) 293–4, 296, 299, 301–3, 305
  consequentiality 18, 23, 35–6, 189, 191, 219
  consumer choice behavior 14, 176–9, 237–8
Contingent valuation of environmental goods

consumer utility theory 83–4, 140, 157, 177
consumer well-being 154, 156, 160, 168, 177–8, 180
contingent valuation (CV)
concepts examined
difficulty answering questions xiii–xv
inadequate response to cost x–xi
inadequate response to number of payments xii
inadequate response to scope xii–xiii, xvii
legal issues xvi
restoration programs xvi–xvii
restricted samples xv
consequentiality as important issue in 35–6
definition 58
estimates of WTP for non-use environmental goods see scope tests
hypothetical bias presence in 29–30, 36
prominent concern about 58
reliability
adding-up test 88–90
examination of criteria 86–8
gradient 154, 179
as ignored issue 91
question of x, 58
recognizing unreliability xvii
survey problems 300
use of term x
use values 82–3
“warm glow” that can arise in 68
see also “composite good” approach; referendum-style CV
contingent valuation method (CVM)
applicability 153
assumptions of 191
comparison to CBC 154, 160
in “composite good” approach 188–9
as controversial in economics community 160
criteria of reliability of 86–7
development of 159–60
hypothetical bias observed with 220
incentive compatibility as issue for 171
as leading SP method 153
legal obstacles
approaches to estimating non-use value for NRD 295
as highly disfavoured by NRD regulations 301–3
for non-use damages 292–3
as not relied on in non-NRD contexts 299–301
as not relied upon in NRD cases 296–9
trustees abandoning as matter of policy 305–6
trustees avoiding 303–5
as mimicking direct democracy by referendum 170
possible reasons for lack of development 154–5
and “protest no” votes 212
recreational use value of birdwatching 179–80
as sensitive to context and survey design considerations 199
tendency to pass scope tests 112–13, 128
typical referendum elicitations 159
valuation of lost use 162, 179
value of experience of SP methods 154
as widely used to value environmental goods and services 1
COS (California oil spill) see “composite good” approach
cost
adding up v. scope test 66, 90
anchoring 2, 5, 10, 84
annual v. one-time payments xii, 43–56
application to endangered shorebird species xi, 17–36
in CBC studies 167, 177
in choice experiments 1–2
household 24–5, 30, 32, 212, 216–17
in logit model of yes/no vote 76–7
in SP valuation of environmental goods x–xi, 1–14
cost-benefit trade-offs see trade-offs
cost prompts see bids
cost scales
  effect of quadrupling costs on mean WTP estimates 8–11, 13–14, 108, 207
effect on consumer goods 14
effect on estimated WTPs 108–12
effect on use and non-use amenities 5, 14
effects on “T&E” species status 11, 14, 207
estimation results for conditional logit model by 12
  in four survey versions 6, 8–11
  frequency of choosing improvement option by 9
  as having strong positive correlation with WTP 108
impact on utility function 11, 14
  influence on WTP 2–5
  and scope effects 109–12
status quo and corner choices by 10–11, 14
